

Code Explanation

Code Explanation: `glue\_pyspark/src/\_\_init\_\_.py`

Purpose

This file serves as the **Python package initializer** for an AWS Glue PySpark job focused on customer order analytics with Slowly Changing Dimension (SCD) Type 2 implementation.---

Step-by-Step Breakdown

Step 1: Package Initialization

- The file marks the `src/` directory as a Python package, allowing its modules to be imported elsewhere.

Step 2: Module Docstring

```
"""AWS Glue PySpark Job PackageCustomer Order Analytics with SCD Type 2
Implementation"""
```

- Provides high-level documentation describing the package's domain (customer order analytics) and key feature (SCD Type 2 tracking for historical data changes).

Step 3: Metadata Definitions

Three module-level constants define package metadata:- **__version__ = "1.0.0"** Declares the current version using semantic versioning.- **__author__ = "Data Engineering Team"** Identifies the responsible team.- **__description__ = "AWS Glue job for customer order analytics with SCD Type 2 tracking"** Summarizes the package's functionality.---

Key Observations

- **No executable logic**: This file only declares metadata; it does not import submodules or execute transformations.- **SCD Type 2 context**: Indicates the job tracks historical changes to dimension records (e.g., customer attributes over time).- **Standard Python convention**: Using `\_\_init\_\_.py` to define package-level attributes is a common practice for discoverability and tooling integration.
