

Code Explanation

Code Explanation: `glue\_pyspark/src/test/\_\_init\_\_.py`

Purpose

This file marks the `test` directory as a Python package and defines its public interface for test modules.

Step-by-Step Breakdown

Step 1: Package Initialization- The file is named `\_\_init\_\_.py`, which designates the `test` directory as a Python package- Allows Python to recognize `test` as an importable module**Step 2: Docstring Documentation**

```
"""Test package for AWS Glue PySpark jobContains unit and integration tests"""
```

- Provides package-level documentation- Indicates this package contains tests for AWS Glue PySpark jobs- Specifies it includes both unit and integration tests**Step 3: Public API Definition**

```
__all__ = ["test_job"]
```

- Defines the public interface of the package- Controls what gets imported when using `from test import`
*- Exposes only `test\_job` as the intended public module- Suggests there is a `test\_job.py` module in the same directory

Functional Impact

- **Import Control**: Only `test\_job` is advertised for external use- **Namespace Management**: Keeps the test package interface clean and explicit- **Documentation**: Clearly identifies the package's scope and purpose

Expected Directory Structure

```
test/■■■ __init__.py (this file)■■■ test_job.py (referenced module)
```
